Teacher Background Information

What is Texas CARES?

The Texas Coronavirus Antibody REsponse Survey (Texas CARES) measures the percentage of participants who have antibodies to SARS-CoV-2 virus in their blood (this measurement is called “seroprevalence”). All Texans 5-80 years of age can participate in the survey. Volunteers complete an informed consent, fill out a questionnaire, and then receive a blood draw at three time points (each three months apart) to determine if they have SARS-CoV-2 antibodies.

Texas CARES is not just *about* the Texas population. It’s also *for* the Texas population.

Texas CARES is sharing information with the public, so that anybody – from public health officials to schoolchildren – can learn more about this project and the antibody response to COVID-19 across Texas! The [Texas CARES dashboard](#) presents the data from the participants updated weekly. Please download the [Dashboard Guide](#) for how to navigate the dashboard and more details about what the data represents

People learn can more about Texas CARES and enroll at www.TexasCARESproject.org.

What are the survey's goals?

- Estimate how many people in Texas have been infected with SARS-CoV-2.
- Estimate how many people have been vaccinated for SARS-CoV-2 and develop antibodies.
- Learn how long COVID-19 antibodies last in someone's system.
- Identify the characteristics of people who develop COVID-19 antibodies.
- Identify the characteristics of people who never develop COVID-19 antibodies.

Interviews

Dr. Eric Boerwinkle shares pertinent information that will set the stage for a successful teaching and learning experience in this 20-minute [interview](#). Dr. Eric Boerwinkle is dean and M. David Low Chair of Public Health at The University of Texas Health Science Center at Houston (UTHealth) School of Public Health.

[ABC13 coverage](#) of Texas CARES: “More than 20 percent of Texans may have COVID-19 antibodies, study shows” by Marla Carter from March 15, 2021.

Texas CARES 5E Lesson for Grades 6-8

Learning Targets

- I can describe what a virus is.
- I can explain how my immune system fights viruses.
- I can explain how researchers investigate questions to new health problems, like the COVID-19 pandemic.
- I can explain how the COVID-19 vaccines work.

Key Vocabulary

Antibody: protein found in the blood that is produced in response to foreign substances (e.g. bacteria or viruses) invading the body. Antibodies protect the body from disease by binding to these organisms and destroying them.

Asymptomatic: a person who has an infectious disease but shows no symptoms

Blood: fluid that transports oxygen and nutrients to the cells and carries away carbon dioxide and other waste products.

COVID-19: a newly-discovered infectious disease caused by a coronavirus

Data: All of the pieces of information that researchers collect or measure

Immune system: The complex system in the body responsible for fighting disease. Its primary function is to identify foreign substances in the body and develop a defense against them. This defense is known as the immune response. It involves production of protein molecules called antibodies to eliminate foreign organisms that invade the body.

Seroprevalence: “Sero-” refers to the blood serum, where antibodies are found, and “-prevalence” is the proportion of individuals in a population who are positive for a measure of interest. Seroprevalence is the percentage of participating individuals who test positive for SARS-CoV-2

Spike protein: spikes made out of proteins that protrude from the outside of coronaviruses and help them infect cells

Survey: a research method used to collect data on a population

Vaccine: a vaccine gives your body directions to make the antibodies that fight pathogens like the coronavirus so you don't get sick (the COVID-19 vaccines available in the US are mRNA vaccines that contain the code that results in the production of antibodies to spike proteins)

Virus: non-living germ that multiplies within cells and causes disease such as chickenpox, measles, mumps, rubella, pertussis and hepatitis.

TEKS Alignment

<p>Health TEKS</p>	<p>6.4B describe various modes of disease transmission 6.8C make healthy choices from among environmental alternatives <i>such as</i> leaving a smoke-filled room or selecting healthy snacks from vending machines. 6.9F describe methods for communicating important issues with parents and peers. 7.3A explain the role of preventive health measures, immunizations, and treatment in disease prevention such as wellness exams and dental check-ups 7.4C demonstrate ways to use health information to help self and others 7.13B relate practices and steps necessary for making health decisions</p>
<p>Science TEKS</p>	<p>6.2, 7.2, and 8.2: (A) plan and implement comparative and descriptive investigations by making observations, asking well defined questions, and using appropriate equipment and technology; (B) design and implement experimental investigations by making observations, asking well defined questions, formulating testable hypotheses, and using appropriate equipment and technology; (C) collect and record data using the International System of Units (SI) and qualitative means such as labeled drawings, writing, and graphic organizers; (D) construct tables and graphs, using repeated trials and means, to organize data and identify patterns; and (E) analyze data to formulate reasonable explanations, communicate valid conclusions supported by the data, and predict trends.</p> <p>6.3D, 7.3D, and 8.3D: Relate the impact of research on scientific thought and society, including the history of science and contributions of scientists as related to the content</p> <p>7.3B use models to represent aspects of the natural world such as human body systems and plant and animal cells. 7.12B identify the main functions of the systems of the human organism, including the circulatory, respiratory, skeletal, muscular, digestive, excretory, reproductive, integumentary, nervous, and endocrine systems</p>
<p>Math TEKS</p>	<p>6.1A, 7.1A, and 8.1A: Apply mathematics to problems arising in everyday life, society, and the workplace. 6.1E, 7.1E, and 8.1E: Create and use representations to organize, record, and communicate mathematical ideas.</p>

The 5E Model: Each part of the 5E is summarized below. The parts should be done in order, starting with Engage. The Explore and Explain can be done in a back-and-forth manner as students need information to complete and understand the Explore activity and communicate their findings from the data investigation.

<p>Engage Teacher Directions and Key</p> <p>The purpose of the Engage activity is to get students interested and personally involved in the lesson and for the teacher to assess prior knowledge.</p>	<p>Coronavirus: Dead or Alive? is an activity that will engage students in thinking about whether the virus that causes COVID-19 is living or nonliving. Have students work in pairs or groups to answer the question and justify their answer and then share as a class. Lead a discussion and come to a class consensus on the best answer and a reasonable justification.</p> <p>Key: The correct answer is Jared and Ashley. A virus is not a cell or composed of cells and cannot reproduce on its own. These are two characteristics of all living things, so without them a virus is not considered a living thing.</p>
<p>Explore Teacher Directions and Key</p> <p>The purpose for the Explore activity is for students to collaborate with other students to build knowledge of the topic by interacting with phenomena.</p>	<p>Read the Teacher Background Information on page 3 prior to doing this activity with your students. There are opportunities throughout the activity to discuss viral infection and prevention, immunity, antibodies, vaccination of adults and children, and how scientists with the Texas CARES project are answering important questions about the percentage of COVID-19 antibodies in the population. The teacher background information will help you prepare for these discussions.</p> <p>Note that for Parts I and II, the data shown in the activities will be different than then continuously updated data in the Texas CARES dashboard. The dashboard guide can be used as a resource for Part III.</p> <p>Background Information for Students: Show these slides to students and use the notes section of the slides to find opportunities for students to answer and ask questions.</p> <p>Have students work in pairs or work with small groups of students.</p> <p>Answer Key for COVID-19 Attack! Data Analysis, Part I: A higher percentage of people ages 29 and under have antibodies in the blood of people than people ages 30-80. They may have been symptomatic or asymptomatic. People with asymptomatic infections can still infect others.</p> <ol style="list-style-type: none"> 1. No could be a reasonable answer because the more kids that are tested, it's possible they will find more kids who have never had COVID-19. When more people are vaccinated in a community, less virus circulates which could lead to less kids contracting COVID-19. Yes is a reasonable answer because the more kids that participate across all areas of Texas - and the more time goes on - it's possible researchers will see a higher seroprevalence in this age group.

	<p>Answer Key to Data Analysis, Part II:</p> <ol style="list-style-type: none"> 15%. Antibody presence may have waned over time to the point that they cannot be detected or the person was misdiagnosed or did not develop antibodies. The vaccine will trigger the body's production of antibodies that are specific to the COVID-19 virus. <p>Teacher directions to Part III: Exploring the Texas CARES Dashboard: Have students work in pairs. Explore the Texas CARES dashboard (https://sph.uth.edu/projects/texascares/dashboard) prior to teaching this part of the lesson. The Dashboard Guide is a helpful resource. Accept answers that are accurate and reasonable.</p> <p>Answer Key, Conclusion: Watch the 20-minute video interview with Dr. Eric Boerwinkle to get an overview of the purpose and goals for the Texas CARES Survey. The study is asking these questions: What is the frequency of individuals in our state who have been exposed to this virus? How long will the antibodies last? How many people in Texas have been infected with the virus? How many people have been vaccinated for SARS-CoV-2 and developed antibodies? How long do COVID-19 antibodies last in someone's system? What are the characteristics of people who never develop COVID-19 antibodies? Student answers will vary.</p>
<p>Explain Teacher Directions and Key</p> <p>The purpose of the Explain activities is for students to build knowledge of the topic and use appropriate vocabulary as they communicate what they have learned.</p>	<p>Use the vocabulary activity that is provided or use the vocabulary words and have students play Think and Throw defining the vocabulary words or drawing a picture as their response.</p> <p>Answer Key: The answers go in the blanks in this order: viruses, COVID-19, replicate, asymptomatic, immune system, antibodies, vaccine, survey, blood, data</p>
<p>Elaborate Teacher Directions and Key</p> <p>The purpose of the Elaborate activities is for students to use their new knowledge to further communicate understanding.</p>	<p>There are three options: health activity, a data activity and science activities. You can assign one or more of these to students, or you can use this as a menu and have students choose one.</p> <p>Students should be creative but also use accurate health and science information.</p> <p>The poster, video, brochure and model projects should be shared with other students in class or on campus, as these are intended to serve as peers teaching peers.</p>

<p>Evaluate Teacher Directions and Key</p> <p>The purpose of the evaluate activities is for students to demonstrate what they have learned.</p>	<p>There are two options: a short quiz (slides linked here) and a Claims-Evidence-Reasoning prompt. You may do one or both with your students.</p> <p>For the CER, students make a claim that answers the question that is posed. They use evidence to back up the claim, then the student provides their reasoning behind the claim using a scientific principle, providing a justification for why the reasoning is important for the claim, or explaining how or why the data counts as evidence. A further step can be added -- peer review or rebuttal. In this fourth step, students examine each other's CERs and provide feedback.</p>
--	--

**The Each activity page can be found on the following pages or linked above.
The Student Background Information and Quiz slides are linked above.**

Engage Activity | Grades 6-8

Coronavirus: Dead or Alive?

Directions: Read the scenario below, read the student responses, then answer the question and justify your decision.

Students are talking about whether or not the coronavirus that causes COVID-19 is living or nonliving.

Didi said it is a *living* thing since it infects humans and causes serious illness.

Maya said it is *nonliving* because it can only be viewed with a microscope.

Jared said it is *nonliving* because it is not composed of one or more cells.

Sergio said it is *living* because it contains genetic material.

Ashley said it is *nonliving* because it cannot make copies of itself on its own.

Question: Which student or students had correct explanations about the virus? Explain your reasoning.

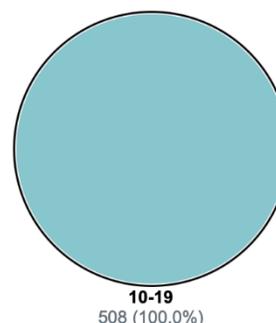

Explore Activity | Grades 6-8 COVID-19 Attack!

Student Data Investigation Part 1: Antibodies in People 10-19 Years of Age

When people who are 10-19 years old had their blood tested by scientists with the Texas CARES Survey to see if they had antibodies for COVID-19, this is what they found:

32.48% of the 508 participants 10-19 years of age had COVID-19 antibodies in their blood.

Percentage and number of Texas CARES participants stratified by **Age groups**

Seropositivity percentage distribution by **Age groups**

The chart below shows the seroprevalence (rounded to the nearest whole number) of COVID-19 antibodies in the blood for each age group Texas CARES researchers are looking at:

Age Group	% of Age Group with COVID-19 Antibodies
Less than 10	33%
10-19	32%
20-29	38%
30-39	23%
40-49	26%
50-59	26%
60-69	24%
70-79	26%
80 and above	17%

Data Analysis, Part I:

What are the researchers finding about the percentage of people with COVID-19 antibodies that are 29 and younger compared to the older age groups?

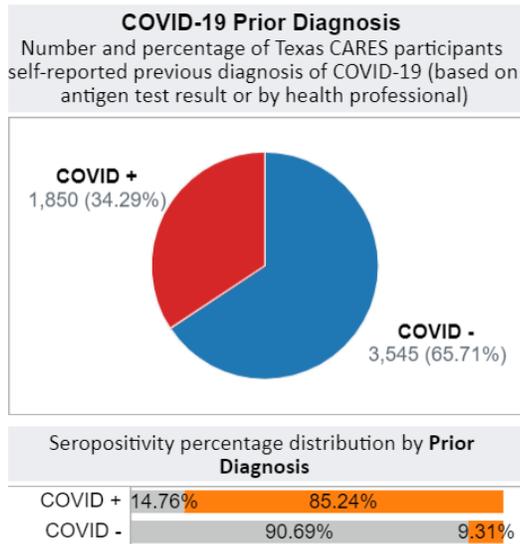

What could be some reasons for these differences?

Do you think these percentages will change as the researchers test more people? Explain your answer.

Part II: Prior COVID-19 Diagnosis and Antibodies

Look at the circle graph below. The red-shaded portion of the graph shows that 34% of the people in all age groups who participated in the survey reported that they had previously been diagnosed with COVID-19.

Researchers with Texas CARES have found that a little over 85% of these people who had COVID-19 in the past have antibodies in their blood.

Data Questions, Part II:

1. If 85% of people who had COVID-19 in the past have antibodies in their blood, then 15% do not have antibodies in their blood. What might be some reasons for this?

2. How would getting vaccinated allow the immune systems of people in this group to develop antibodies against COVID-19?

Part III: Exploring the Texas CARES Dashboard

The Texas CARES researchers are studying the following demographic data from participants:

- Age
- Sex
- Ethnicity
- Race

Choose one of these to explore on the [Texas CARES dashboard](https://sph.uth.edu/projects/texascares/dashboard) (https://sph.uth.edu/projects/texascares/dashboard). What are two questions that you want to explore about the demographic that you chose? Write your findings in the chart below.

Demographic I explored: _____

Questions	Findings in the data
1.	
2.	

Conclusion:

Write a paragraph describing the importance of the Texas CARES study and what the data findings will do to help people understand the impact of COVID-19 in Texas.

Explain Activity | Grades 6-8 Vocabulary Activity

Word Bank:

Antibodies Blood Viruses Vaccine Replicate Data
COVID-19 Immune System Survey Asymptomatic

_____ are pathogens that can enter your body and make you sick. A new virus that has spread around the world and has made many people sick is a coronavirus that causes _____. When a person infected with COVID-19 breathes out air or coughs, the virus can enter your body through your nose, mouth or eyes and enter the cells of your body and _____. Some people get infected and don't show symptoms of COVID-19. These people are called _____.

Your _____ protects your body from outside invaders like viruses. The immune system creates attackers called _____ that will help fight off COVID-19 the next time you are exposed to it. A person who has had COVID-19 or has received a COVID-19 _____ will produce antibodies in their blood.

Scientists with the Texas CARES _____ are finding out more about who has antibodies to COVID-19 by testing people's _____. The _____ they are collecting will help them determine who has antibodies and how long they last.

Elaborate Activities | Grades 6-8

Option 1: Health Activity Stop the Spread!

Create a video, poster or brochure that helps students, family members or the community know how to make healthy choices about COVID-19. Choose from one of these topics:

- Prevention strategies - how not to get infected with COVID-19 or infect others
- Importance of getting a COVID-19 vaccine when it is available to you

Be sure to use respectful communication and accurate information.

Option 2: Data Activity: [Be a Researcher!](#)

Create your own data investigation. The activity is on page 15.

Option 3: Science Activities

Antibody Attack!

Create a model showing how the virus that causes COVID-19 invades the body and how the body attacks the invading virus with antibodies.

Be sure and label your poster or model using vocabulary such as coronavirus, respiratory system, lungs, circulatory system, blood, immune system, COVID-19 and antibodies.

Use your imagination and make this fun and creative while communicating accurate science information.

Elaborate Activities | Grades 6-8

Be a Researcher!

A **researcher** collects information to try to understand or solve a problem.

A **survey** is a set of questions that researchers ask to learn more about people in a study.

Data is all of the pieces of information that researchers collect or measure in a research study.

Sample Size is the number of people signed up for a study. The more, the better!

Now it's your turn to be a researcher!

1. Brainstorm some scientific questions that researchers could study. *Example: How does the food that people eat affect their health?*

1. Pick ONE of your questions. *The question I am going to focus on is:*

Designing a Study

1. Now that you know what scientific question you are going to research, it's time to design a study. Use the template below to plan your study design. See an example on the next page.

Who will participate in your study?

How many people will you recruit for your study?

What data will you collect?

2. One study tool that can help you learn more about your participants is a survey. Use the template below to plan out your key survey questions.

Survey Questions to Include:

- _____
- _____
- _____
- _____

What conclusions will you be able to make from your study?

Study Example: How does the food that people eat affect their health?

Who will participate in your study? I will recruit people ages 5 to 50 who live in Texas.

How many people will you recruit for your study? I will aim to recruit as many people as possible. Ideally, I will recruit 250,000 people.

What data will you collect? I will give my participants a survey where I ask them about their health and the foods that they eat. I will also ask about other lifestyle aspects like whether or not they exercise. I will also have each of my participants take a physical exam at a doctor's office, including blood work. I will also ask for information like their age, gender and where they work.

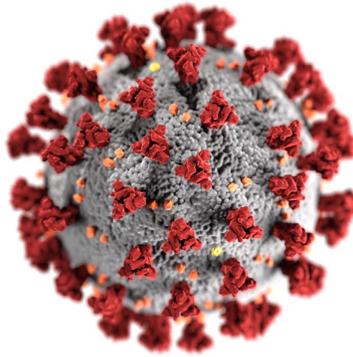

Survey Questions to Include:

- What kinds of foods do you regularly eat?
- How long do you exercise for each week?
- Do you have any medical conditions?
- Do you currently take any medicine?
- How old are you?
- Do you identify as male, female or prefer not to say?
- Where do you work?

What conclusions will you be able to make from your study? I will be able to look at the foods that they eat and compare it to their physical exam results to be able to try and make a connection between the foods that the participants regularly eat and how healthy they are.

Evaluate Activity | Grades 6-8

Claim-Evidence-Reasoning: The Evidence is in the Blood

Watch the first video in the [ABC13 news story](#), “More Than 20 Percent of Texans May Have COVID-19 Antibodies, Study Shows,” by Marla Carter.

In the video, Dr. Eric Boerwinkle, the dean of The University of Texas Health Science Center at Houston (UTHealth) School of Public Health, makes the claim that if you want to know what frequency of individuals have been infected with COVID-19, there is really only one way to find out—to look for antibodies in the blood.

Develop a Claims-Evidence-Reasoning using Dr. Boerwinkle’s claim. Your evidence and reasoning should reflect what you have learned about COVID-19, antibodies and Texas CARES.

Claim:

Evidence:

Reasoning:
